

## Day 11 – Assignment :

The image shows a Visual Studio Code editor window with a Python file named `day11.py`. The code defines a list of numbers and performs three operations: printing the numbers, calculating their sum, and finding the largest number. The output of the script is displayed in the terminal panel below the editor.

```
day11.py > ...
1  numbers = [10,11,12,13]
2  # print numbers
3  for num in numbers:
4      print(num)
5
6  # find sum of the list
7  total = 0
8  for num in numbers:
9      total = total + num
10 print("sum = ",total)
11
12 # find count of the list
13 count = 0
14 for num in numbers :
15     count += 1
16 print("count =", count)
17
18 # find the largest no of list
19 largest = numbers[0]
20 for num in numbers:
21     if num > largest:
22         largest = num
23 print("Largest = ", largest)
24
```

The terminal panel shows the execution of the script:

```
PS D:\SLA\Python> python day11.py
10
11
12
13
sum = 46
count = 4
Largest = 13
PS D:\SLA\Python>
```

The status bar at the bottom indicates the file is encoded in UTF-8, uses CRLF line endings, and is a Python 3.14.5 file.
