1 # print a function with returning multiple values
2 def student():
3     name = "Selva"
4     age = 21
5     score = 85
6
7     return name, age, score
8
9 name, age, score = student()
10
11 print("Name :", name)
12 print("Age :", age)
13 print("Score :", score)
14
15 # Do a arithmetic calculator program using functions
16 def add(a, b):
17     return a + b
18
19 def sub(a, b):
20     return a - b
21
22 def mul(a, b):
23     return a * b
24
25 def div(a, b):
26     return a / b
27
28 a = int(input("Enter first number: "))
29 b = int(input("Enter second number: "))
30
31 print("Addition =", add(a, b))
32 print("Subtraction =", sub(a, b))
33 print("Multiplication =", mul(a, b))
34 print("Division =", div(a, b))
```

7. Difference Between Function Call and return.

Function Call	return keyword.
1. used to execute a function	used to send a value back from a function
2. Example add(5,3)	Example return a+b
3. Starts the Function	Ends the function and return the result

Example:-

```
def add(a,b):
    return a+b

result = add(5,3)
print(result)
```

```

37
38 # CREATE A FUNCTION FOR PRIME NUMBER
39 def prime(n):
40     if n <= 1:
41         return False
42
43     for i in range(2, n):
44         if n % i == 0:
45             return False
46
47     return True
48
49 num = int(input("Enter a number: "))
50
51 if prime(num):
52     print("Prime Number")
53 else:
54     print("Not a Prime Number")
55
56 # program to find even nos using lambda
57 numbers = [1,2,3,4,5,6,7,8,9,10]
58
59 even = list(filter(lambda x: x % 2 == 0, numbers))
60
61 print("Even Numbers:", even)

```
