Course : Python Full Stack

Date : 3.07.2026.

### oops Test

1. create a vehicle class without any variables and Methods.

```
class vehicle :  
    pass.
```

2. create a child class Bus that inherit from vehicle.

```
class vehicle :  
    pass
```

```
class Bus(vehicle):  
    pass
```

```
b = Bus()
```

```
print("Bus class created successfully")
```

3. Define a property that must have the same value for every class instance (object)  
Define a class attribute "color" with a default value white.

code:

```
class Vehicle:
```

```
    color = "white"
```

```
class Bus(Vehicle):
```

```
    pass
```

```
class Car(Vehicle):
```

```
    pass
```

```
bus = Bus()
```

```
car = Car()
```

```
print("Bus color:", bus.color)
```

```
print("Car colour:", car.color)
```

A) class attribute country with default value "USA",

```
class Person:
```

```
    country = "USA"
```

```
class Student(Person):
```

```
    pass
```

```
class Teacher(Person):
```

```
    pass
```

```
s = Student()
```

```
t = Teacher()
```

```
print("Student country:", s.country)
```

```
print("Teacher country:", t.country)
```

5. Bank class with class attribute currency.

```
class Bank:
```

```
    currency = "USD"
```

```
class SavingsAccount(Bank):
```

```
    Pass.
```

```
class checkingAccount(Bank):
```

```
    currency = "INR"
```

```
s = SavingsAccount()
```

```
c = checkingAccount()
```

```
print("Savings Account currency:", s.currency)
```

```
print("checking Account currency:", c.currency)
```

6. Car class with private attribute - engine\_number,

```
class Car:
```

```
    def __init__(self, engine_number):
```

```
        self.__engine_number = engine_number
```

```
    def get_engine_number(self):
```

```
        return self.__engine_number
```

```
car = Car("ENG12345")
```

```
print("Engine Number:", car.get_engine_number())
```

7) Abstract class Animal with speak()  
from abc import ABC, abstractmethod

```
class Animal(ABC):
```

```
    @abstractmethod
```

```
    def speak(self):
```

```
        pass
```

```
class Dog(Animal):
```

```
    def speak(self):
```

```
        print("Dog says: 'Bark'")
```

```
class Cat(Animal):
```

```
    def speak(self):
```

```
        print("Cat says: 'Meow'")
```

```
d = Dog()
```

```
c = Cat()
```

```
d.speak()
```

```
c.speak()
```

8) vehicle class with instance attributes:

```
class Vehicle:
```

```
    def __init__(self, max_speed, mileage):
```

```
        self.max_speed = max_speed
```

```
        self.mileage = mileage
```

```
car = Vehicle(180, 20)
```

```
print("Max", car.max_speed)
```

```
print("Mileage", car.mileage)
```

9) Take a three digit number and add the square of each digit.

num = input("Enter a digit number:")

total = 0

for digit in num:

total += int(digit) \* 2

print("Sum of square", total)
