

Javascript Function Tasks :: (With Loops & conditions).

Part A:

1. What is a function in Javascript?

* A Block of code used to perform a task. it is mainly used for reusability.

2. How do you define a function? ::

* function function name (^{parameter}) {

 //code

}

function name();

3. What is the Purpose of the return keyword?

* sends value back from function.

4. Difference between function Declaration & function Expression.

Function Declaration.	Function Expression.
1. Defined using function keyword with a name.	Function is assigned to a variable.
2. Hoisted - can call before definition.	No hoisted - cannot ^{call} before definition.

5. What is an arrow function? Give one example.

An arrow function is a shorter way to write functions in javascript using the $\Rightarrow$ symbol.

```
const add = (a, b)  $\Rightarrow$  a + b;  
console.log(add(2, 3));
```

6. Can a function call another function?

yes function call another function.

Example:
function myfunc(a, b) {

```
  let add = (a + b);  
  sub = subtract();  
}  
myfunc(2, 3);
```

7. What happens if a function doesn't have a return statement?

If a function does not use a return statement, it will automatically return undefined.

Ex:

```
function test() {  
  console.log("Hello");  
}  
let result = test();  
console.log(result);
```

8. What is the scope of a variable declared inside a function?

scope: Local scope (Inside function only).

9. Write the syntax for calling a function?

```
function function-name(a, b) {
```

```
    let value = a + b;
```

```
    console.log(value);
```

```
}
```

```
function-name(2, 3);
```

10. What does arguments mean inside a function?

* arguments are ^{used to} passed in function that

will be passed as values.
